# Heterosis estimation for seed cotton yield and its component traits in interspecific hybrids of cotton 

Jaimin M Vadodariya, Balvant C Patel, Mukesh P Patel, Sunil K Patel and Sumit D Panchal

#### Abstract

This investigation was undertaken to obtain information on magnitude of heterobeltiosis and standard heterosis for seed cotton yield and its component traits in interspecific hybrids of cotton. The experimental material comprised of five female parents, nine male parents and their resultant 45 hybrids developed by line $\times$ tester mating design and one standard check G. Cot. Hy. 102. The experiment was laid out in randomized complete block design with three replications at Regional Research Station, Anand Agricultural University, Anand during Kharif-2021. Among the 45 hybrids, 21 hybrids showed significantly positive heterosis over better parent and 11 hybrids showed positively significant heterosis over standard check G. Cot. Hy. 102 for seed cotton yield per plant. As per better parent heterosis, the best performing positively significant hybrids for seed cotton yield per plant were AHC-26 $\times$ ARBB-27, G. Cot-12 $\times$ GSB-43-1 and AHC- $26 \times$ DB- 1502 while as per standard heterosis, the outstanding positively significant hybrids for seed cotton yield per plant were AHC- $1 \times$ DB-1502, AHC-1 $\times$ GSB-45 and AHC- $26 \times$ ARBB-27. These cross combinations can be further exploited in breeding programmes of cotton.

Keywords: Heterobeltiosis, standard heterosis, cotton, line $\times$ tester mating design

## Introduction

Cotton is also known as White Gold as well as King of fiber crops and mainly often crosspollinated crop which belongs to the family Malvaceae and genus Gossypium. Genus Gossypium includes approximately 50 species, out of which 43 are diploid and seven are tetraploid in nature but only four species are cultivated which are G. hirsutum L., G. barbadense L., G. arboreum L. and G. herbaceum L. Among the four cultivated species, G. arboreum L. and $G$. herbaceum L. are diploid $(2 \mathrm{n}=2 \mathrm{x}=26)$ in nature and known as old world cotton while, G. hirsutum L. and G. barbadense L. are tetraploid $(2 n=4 x=52)$ in nature and known as new world cotton. The species which are referred to as its progenitors are $G$. africanum L. and G. raimondii L. African linted diploid species (G. africanum L.) reached America through Pacific Ocean and after crossing with American lintless wild diploid species ( G. raimondii L.) gave birth to tetraploid cotton. The chromosome doubling took place in nature resulting in the development of fertile amphidiploids (G. hirsutum L.).
India ranks first in terms of area ( 13.47 million hectares), while second in terms of production ( 12.88 million tonnes) among cotton growing countries after China, whereas, productivity is around $955.7 \mathrm{~kg} / \mathrm{ha}$ in India (Anon., 2020) ${ }^{[1]}$.
Cotton production in the country got momentum with release of the world's first cotton hybrid H-4 by Late Dr. C. T. Patel in the year 1970 from Main Cotton Research Station, GAU, Surat, Gujarat. The key characteristic of the species like, G. hirsutum L. having high yielding potential and G. barbadense L. has excellent fiber quality makes it possible to producing hybrids with higher yield and superior fiber quality through interspecific hybridization. India resides pioneer in commercialization of heterosis in cotton. Heterosis is the superiority of $\mathrm{F}_{1}$ hybrid in a desirable direction over either or both of the parents and standard check is manifested via an increase in vigour, growth rate, size, yield, quality and other important characteristics. Exploitation of heterosis on commercial scale leads to develop a number of high yielding hybrids, which proved to be most important genetic tool in enhancing yield potential of crops and considered as the most important breakthrough in the field of crop improvement.

## Material and Methods

For present investigation the crossing program was undertaken during Kharif 2020 and evaluation was carried out in Kharif 2021 at the Regional Research Station, Anand Agricultural University, Anand. The experimental material comprised of five lines ( $G$. hirsutum), nine testers ( $G$. barbadense), 45 hybrids and one standard check. These lines and testers were crossed in line $\times$ tester fashion to obtain 45 interspecific hybrids. The experiment was laid out in randomized complete block design with three replications. The lines were AHC-1 (L1), G. Cot-12 (L2), G. Cot-20 (L3), AHC-50 (L4) and AHC-26 (L5), and testers were ABC-1 (T1), ARBB-27 (T2). GSB-41 (T3), GSB-43-1 (T4), GSB-44 (T5), GSB-45 (T6), DB-1502 (T7), RHcb-1014 (T8) and DB1602 (T9) and one standard check was G. Cot. Hy. 102. The seeds of $45 \mathrm{~F}_{1} \mathrm{~s}$ were produced by hand pollination and parent seeds were obtained by selfing of parents. The package of practices will be followed as per the recommendations for raising the good and healthy crop. Observations were recorded for 16 different characters viz., days to $50 \%$ flowering, days to $50 \%$ boll bursting, plant height, monopodia per plant, sympodia per plant, bolls per plant, boll weight, ginning outturn, fiber fineness, fiber strength, fiber length, uniformity index, seed index, lint index, lint yield per plant and seed cotton yield per plant. The experimental plot wise mean values of five randomly selected plants were used in each statistical analysis for different characters. The estimation of heterosis over better parent and standard check
is more realistic. Hence, in the present investigation, heterosis was estimated over better parent and standard check, referred to as heterobeltiosis and standard heterosis, respectively.

## Results and Discussion

The analysis of variance showed that mean sum of squares (Table 1) due to genotypes was highly significant for seed cotton yield and its component traits. This indicated that experimental material used in the present study had sufficient variability for different characters. Parental variances were found highly significant for all the characters except uniformity index. The variance of hybrids were found highly significant for all the characters indicating the presence of significant genetic variability among the hybrids for all the characters under study. The analysis of variance for parents vs. hybrids were also found highly significant for all characters indicating significant amount of heterosis generated in the present investigation.
For days to $50 \%$ flowering and days to $50 \%$ boll bursting, the parent which took minimum days was considered to be a better parent and for monopodia per plant and fiber fineness, the parent with minimal value was considered to be a better parent and accordingly heterosis were calculated. For these characters heterotic effect in the negative direction were desirable. The heterotic effects were desirable in positive direction for all the remaining characters except mentioned above.

Fig 1: Field view of cotton evaluation block at RRS, AAU, Anand (Kharif 2021-22)

Fig 2: Heterobeltiosis and standard heterosis of all hybrids for seed cotton yield per plant

## Days to $\mathbf{5 0 \%}$ flowering

As per better parent heterosis, the best performing negatively significant hybrids for days to $50 \%$ flowering were AHC- $26 \times$ GSB-45 (-4.95\%), AHC-26 $\times$ DB-1502 ( $-1.98 \%$ ) and AHC$50 \times$ ABC-1 $(-0.53 \%)$. As per standard heterosis, the best performing negatively significant hybrids were AHC-50 $\times$ ABC-1 ( $-9.62 \%$ ), AHC-26 $\times$ GSB-45 ( $-7.69 \%$ ) and AHC- $1 \times$ DB-1502, AHC-1 $\times$ RHcb-1014, AHC-50 $\times$ RHcb-1014, AHC-26 $\times$ DB-1502 ( $-4.81 \%$ ). The results are in close agreement with Gohil et al. (2017) ${ }^{[3]}$, Vavdiya et al. (2019) ${ }^{[14]}$ and Udaya et al. (2020) ${ }^{[13]}$ for both heterobeltiosis and standard heterosis while, Malathi et al. (2019) ${ }^{[6]}$ showed similar results for heterobeltiosis and Sawarkar et al. (2015) ${ }^{[11]}$ showed similar results for standard heterosis only.

## Days to $\mathbf{5 0 \%}$ boll bursting

According to better parent heterosis, none of the hybrids showed negatively significant heterotic effects for days to $50 \%$ boll bursting. While, as per the standard heterosis, best performing negatively significant hybrids were AHC $-1 \times$ DB1502 (-9.09\%), AHC-1 $\times$ RHcb-1014 (-8.83\%) and AHC-50
$\times$ DB-1502 ( $-7.79 \%$ ). The outcome of this experiment is in contradictory for heterobeltiosis however, it shows similarity for standard heterosis with the results of Sawarkar et al. (2015) ${ }^{[11]}$ and Vavdiya et al. (2019) ${ }^{[14]}$.

## Plant height

The best performing positively significant hybrid for plant height as per better parent heterosis were AHC- $26 \times$ GSB-41 (41.11\%), G. Cot-20 $\times$ GSB-41 (39.97\%) and AHC-26 $\times$ ABC-1 (36.53\%). As per standard heterosis, the best performing positively significant hybrids were AHC-1 $\times$ ARBB-27 (21.58\%), G. Cot-20 $\times$ ARBB-27 (20.75\%) and AHC-26 $\times$ ABC-1 (18.69\%). Significantly positive heterobeltiosis and standard heterosis was also reported by Gohil et al. (2017) ${ }^{[3]}$, Malathi et al. (2019) ${ }^{[6]}$, Vavdiya et al. (2019) ${ }^{[14]}$ and Naik et al. (2020b) ${ }^{[9]}$. Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ reported similar findings for standard heterosis.

## Monopodia per plant

As per better parent heterosis, the best performing negatively
significant hybrid were G. Cot-12 $\times$ GSB-44 ( $-15.55 \%$ ) and G. Cot-12 $\times$ ABC-1 ( $-10.92 \%$ ). As per standard heterosis, the best performing negatively significant hybrids were G. Cot-12 $\times$ GSB-44 (-29.63\%), AHC-50 $\times$ DB-1502 ( $-25.94 \%$ ) and G. Cot- $20 \times$ GSB-45 ( $-20.36 \%$ ). These results are in concurrence with Gohil et al. (2017) ${ }^{[3]}$, Vavdiya et al. (2019) ${ }^{[14]}$ and Sudha et al. (2020) ${ }^{[12]}$ for heterobeltiosis and standard heterosis. Udaya et al. (2020) ${ }^{[13]}$ and Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ reported significantly negative standard heterosis only.

## Sympodia per plant

According to better parent heterosis, the best performing positively significant hybrid were AHC-26 $\times$ ABC-1 (47.29\%), AHC-26 $\times$ DB-1502 (41.09\%) and AHC-26 $\times$ GSB-44 (40.18\%). As per standard heterosis, the best performing positively significant hybrids were AHC-1 $\times$ GSB-45 (31.49\%), AHC-1 $\times$ DB-1602 (25.73\%) and AHC-26 $\times$ GSB-44 (24.15\%). The present findings are in fidelity with the reports of Gohil et al. (2017) ${ }^{[3]}$, Malathi et al. (2019) ${ }^{[6]}$, Vavdiya et al. (2019) ${ }^{[14]}$ and Sudha et al. (2020) ${ }^{[12]}$ for heterobeltiosis and standard heterosis and Udaya et al. (2020) ${ }^{[13]}$ for standard heterosis only.

## Bolls per plant

The best performing positively significant hybrid as per better parent heterosis were AHC-1 $\times$ GSB-43-1 (90.54\%), G. Cot$12 \times$ GSB-45 (85.27\%) and G. Cot-12 $\times$ GSB-43-1 (80.63\%). As per standard heterosis, the best performing positively significant hybrids were AHC-1 $\times$ DB-1502 (34.56\%), AHC$1 \times$ GSB-43-1 (33.49\%) and AHC-50 $\times$ ABC-1 (32.07\%). The present findings are in accordance with the reports of Patel et al. (2015) ${ }^{[10]}$, Gohil et al. (2017) ${ }^{[3]}$, Vavdiya et al. (2019) ${ }^{[14]}$, Naik et al. (2020b) ${ }^{[9]}$ and Sudha et al. (2020) ${ }^{[12]}$ for both heterobeltiosis and standard heterosis while, with reports of Malathi et al. (2019) ${ }^{[6]}$, Hibbiny et al. (2020) ${ }^{[5]}$ and Hamed and Said (2021) ${ }^{[4]}$ for heterobeltiosis only and with Sawarkar et al. (2015) ${ }^{[11]}$, Monicashree et al. (2017) ${ }^{[7]}$, Udaya et al. (2020) ${ }^{[13]}$ and Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ for standard heterosis only.

## Boll weight

As per better parent heterosis, the best performing positively significant hybrid for boll weight were G. Cot-20 $\times \mathrm{ABC}-1$ ( $8.21 \%$ ) and AHC-50 $\times$ DB-1602 ( $8.10 \%$ ). As per standard heterosis, the best performing positively significant hybrids were AHC-26 $\times$ GSB-45 (39.34\%), AHC-26 $\times$ DB-1502 $(33.03 \%)$ and AHC-1 $\times$ GSB-41 ( $30.90 \%$ ). These results are in akin with the reports of Patel et al. (2015) ${ }^{[10]}$, Gohil et al. (2017), Vavdiya et al. (2019) ${ }^{[14]}$, Naik et al. (2020b) ${ }^{[9]}$ and Sudha et al. (2020) ${ }^{[12]}$ for both heterobeltiosis and standard heterosis while, Malathi et al. (2019) ${ }^{[6]}$, Hibbiny et al. (2020) ${ }^{[5]}$ and Hamed and Said (2021) ${ }^{[4]}$ found similar results only for heterobeltiosis. Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ reported significant positive standard heterosis for boll weight.

## Ginning outturn

According to better parent heterosis, the best performing positively significant hybrid for ginning outturn were G. Cot$20 \times$ GSB-43-1 (5.70\%), AHC-50 $\times$ GSB-43-1 (5.56\%) and AHC-50 $\times$ GSB-41 ( $4.02 \%$ ). As per standard heterosis, the best performing positively significant hybrids were AHC-50 $\times$

GSB-43-1 (18.29\%), AHC-50 $\times$ GSB-41 (16.56\%) and G. Cot-20 $\times$ GSB-43-1 (15.73\%). Above results were in close agreement with Vavdiya et al. (2019) ${ }^{[14]}$ and Naik et al. (2020b) ${ }^{[9]}$ for heterobeltiosis and standard heterosis both. While, significant and positive standard heterosis was also reported by Patel et al. (2015) ${ }^{[10]}$, Udaya et al. (2020) ${ }^{[13]}$ and Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$.

## Fiber fineness

The best performing negatively significant hybrid as per better parent heterosis were G. Cot-20 $\times$ GSB-45 ( $-20.41 \%$ ), AHC-1 $\times$ DB-1502 ( $-19.57 \%$ ) and G. Cot-20 $\times$ DB-1502 ( $18.75 \%$ ). As per standard heterosis, the best performing negatively significant hybrids were G. Cot-12 $\times$ DB-1602 ( $10.81 \%$ ), G. Cot-12 $\times$ RHcb-1014 ( $-8.11 \%$ ) and G. Cot-12 $\times$ GSB-41, G. Cot-12 $\times$ GSB-43-1, AHC-26 $\times$ GSB-41 ($5.41 \%$ ). The results of this investigation show similarity with the earlier works of Naik et al. (2020a) for heterobeltiosis and standard heterosis. Sawarkar et al. (2015) ${ }^{[11]}$, Hibbiny et al. (2020) ${ }^{[5]}$ and Hamed and Said (2021) ${ }^{[4]}$ reported similar findings for heterobeltiosis while, Monicashree et al. (2017) ${ }^{[7]}$ and Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ reported similar findings for standard heterosis only.

## Fiber strength

As per better parent heterosis, the best performing positively significant hybrid were G. Cot-12 $\times$ DB-1502, G. Cot-20 $\times$ DB-1502 (15.22\%), AHC-1 $\times$ DB-1502 (11.42\%) and G. Cot$20 \times$ GSB-43-1 $(9.49 \%)$. As per standard heterosis, the best performing positively significant hybrids were G. Cot-20 $\times$ GSB-43-1 (9.15\%), AHC-26 $\times$ GSB-43-1 (8.83\%) and AHC$1 \times$ DB-1602, G. Cot-20 $\times$ ARBB-27 (8.52\%). As observed in the present investigation, Naik et al. (2020a) had also reported the significantly positive heterobeltiosis and standard heterosis while, Hibbiny et al. (2020) ${ }^{[5]}$ and Hamed and Said (2021) ${ }^{[4]}$ reported significant positive heterobeltiosis and Sawarkar et al. (2015) ${ }^{[11]}$, Monicashree et al. (2017) ${ }^{[7]}$ and Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ reported significant and positive standard heterosis for fiber strength.

## Fiber length

According to better parent heterosis, the best performing positively significant hybrid were AHC-26 $\times$ DB-1502 ( $19.10 \%$ ), AHC- $26 \times$ ARBB-27 ( $16.77 \%$ ) and AHC-50 $\times$ DB1502 (16.32\%). As per standard heterosis, the hybrids AHC$50 \times$ GSB-43-1 (5.61\%), AHC-26 $\times$ ARBB-27 (5.03\%) and AHC-1 $\times$ GSB-43-1, AHC-26 $\times$ RHcb-1014 (4.74\%) were best performing. Naik et al. (2020a) had also reported significant and positive heterobeltiosis and standard heterosis. Similar results were also reported by Hamed and Said (2021) ${ }^{[4]}$ for heterobeltiosis and Patel et al. (2015) ${ }^{[10]}$, Sawarkar et al. (2015) ${ }^{[11]}$, Gohil et al. (2017) ${ }^{[3]}$ and Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ for standard heterosis.

## Uniformity index

As per better parent heterosis, the best performing positively significant hybrid for were G. Cot-12 $\times$ GSB-45, AHC-50 $\times$ RHcb-1014 (3.57\%), AHC-1 $\times$ GSB-45, AHC- $1 \times$ RHcb1014 (2.38\%) and AHC-1 $\times$ ABC-1, AHC- $1 \times$ GSB-43-1, G. Cot-12 $\times$ ABC-1 (2.35\%) for uniformity index. As per standard heterosis, the best performing positively significant hybrids were AHC- $1 \times$ GSB-44 (3.57\%), G. Cot-12 $\times$ ABC-1 $(3.57 \%)$ and AHC-50 $\times$ RHcb-1014 (3.57\%). Hibbiny et al.
(2020) ${ }^{[5]}$ and Hamed and Said (2021) ${ }^{[4]}$ also reported significant positive heterobeltiosis while, Monicashree et al. (2017) ${ }^{[7]}$ and Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ reported significantly positive standard heterosis only.

## Seed index

As per better parent heterosis, the best performing positively significant hybrid for seed index were G. Cot-20 $\times$ DB-1502 (36.95\%), G. Cot-20 $\times$ RHcb-1014 (34.57\%) and G. Cot-12 $\times$ RHcb-1014 (32.38\%). As per standard heterosis, the best performing positively significant hybrids were AHC-26 $\times$ GSB-45 (12.97\%), AHC-26 $\times$ GSB-44 (11.99\%) and AHC-26 $\times$ ABC-1 $(9.08 \%)$ for seed index. Similar results were obtained by Gohil et al. (2017) ${ }^{[3]}$, Malathi et al. (2019) ${ }^{[6]}$, Vavdiya et al. (2019) ${ }^{[14]}$ and Naik et al. (2020b) ${ }^{[9]}$ for both heterobeltiosis as well as standard heterosis while, Hibbiny et al. (2020) ${ }^{[5]}$ and Hamed and Said (2021) ${ }^{[4]}$ found significant positive heterobeltiosis and Monicashre et al. (2017), Sudha et al. (2020) ${ }^{[12]}$, Udaya et al. (2020) ${ }^{[13]}$ and Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ found significantly positive standard heterosis for seed index.

## Lint index

The best performing positively significant hybrid according to better parent heterosis were G. Cot-20 $\times$ GSB-43-1 (35.82\%), AHC-50 $\times$ GSB-41 (30.87\%) and AHC-50 $\times$ GSB-43-1 (30.25\%). As per standard heterosis, the best performing positively significant hybrids were AHC-26 $\times$ GSB-45 ( $21.81 \%$ ) followed by AHC-26 $\times$ GSB-43-1 ( $15.71 \%$ ) and AHC-26 $\times$ GSB-44 (14.74\%). Significant and positive heterobeltiosis and standard heterosis were also reported by Gohil et al. (2017) ${ }^{[3]}$, Vavdiya et al. (2019) ${ }^{[14]}$ and Sudha et al. (2020) ${ }^{[12]}$. Hibbiny et al. (2020) ${ }^{[5]}$, and Hamed and Said (2021) ${ }^{[4]}$ also found significant positive heterobeltiosis while, Udaya et al. (2020) ${ }^{[13]}$ and Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ found significant positive standard heterosis.

## Lint yield per plant

As per better parent heterosis, the best performing positively significant hybrid were G. Cot-12 $\times$ GSB-43-1 (51.24\%), AHC-26 $\times$ ARBB-27 (45.91\%) and G. Cot-20 $\times$ ABC-1 ( $39.96 \%$ ). As per standard heterosis, the hybrids AHC-1 $\times$ DB-1502 (63.95\%), AHC-1 $\times$ GSB-45 (57.27\%) and AHC-1 $\times$ RHcb-1014 $(51.32 \%)$ were best performing. The results are in conformity with the reports of Patel et al. (2015) ${ }^{[10]}$, Gohil et al. (2017) ${ }^{[3]}$ and Sudha et al. (2020) ${ }^{[12]}$ for heterobeltiosis as well as standard heterosis while, Hibbiny et al. (2020) ${ }^{[5]}$ and Hamed and Said (2021) ${ }^{[4]}$ got similar results for heterobeltiosis.

## Seed cotton yield per plant

According to better parent heterosis, the best performing positively significant hybrid for seed cotton yield per plant were AHC- $26 \times$ ARBB-27 ( $65.57 \%$ ) followed by G. Cot-12 $\times$ GSB-43-1 (61.53\%) and AHC-26 $\times$ DB-1502 (50.31\%). While, as per standard heterosis, the outstanding and positively significant hybrids were AHC-1 $\times$ DB-1502 (59.57\%), AHC-1 $\times$ GSB-45 (53.15\%) and AHC-26 $\times$ ARBB-27 (47.72\%). The earlier investigation of Patel et al. (2015) ${ }^{[10]}$, Sawarkar et al. (2015) ${ }^{[11]}$, Gohil et al. (2017) ${ }^{[3]}$, Malathi et al. (2019) ${ }^{[16]}$, Vavdiya et al. (2019) ${ }^{[14]}$ and Naik et al. (2020) showed agreement with the present result of heterobeltiosis and standard heterosis and those of Hibbiny et
al. (2020) ${ }^{[5]}$, Sudha et al. (2020) ${ }^{[12]}$ and Hamed and Said $(2021){ }^{[4]}$ showed similarly significant positive heterobeltiosis. The earlier studies of Monicashree et al. (2017) ${ }^{[7]}$, Udaya et al. (2020) ${ }^{[13]}$, Gnanasekaran and Thiyagu (2021) ${ }^{[21]}$ supports the present result of positive and significant SH .

## Conclusions

Significant levels of desirable heterobeltiosis and standard heterosis was registered in the current investigation for seed cotton yield per plant and its component traits. These suggests the possibility for improvement of cotton through heterosis breeding. Out of 45 hybrids developed, AHC- $1 \times$ DB-1502, AHC- $1 \times$ GSB-45, AHC-26 $\times$ ARBB-27, AHC- $1 \times$ GSB-43-1 and $G$. Cot- $20 \times$ ABC-1 were most promising cross combinations for seed cotton yield per plant on the basis of standard heterosis. Therefore, these cross combinations may be favoured for commercial cultivation as hybrids after critical evaluation in varied environments or over locations. These hybrids may also be further advanced for development of superior desirable recombinants as improved varieties.

## Acknowledgement

The authors are thankful to Anand Agricultural University, Anand, Gujarat, India for providing required facilities to carried out the research experiment.
