Identification of resistant sources of wheat against spot blotch (*Bipolaris sorokiniana*) disease

Rahul Singh Raghuvanshi, Subhash Chandra, Abhishek Singh, Akash Singh and Anand Milan

Abstract

Creating resistant agricultural disease-resistant cultivars is the most efficient way to control crop diseases. At the MES farm of the Acharya Narendra Deva University in Kumarganj, Ayodhya, Uttar Pradesh, 218 wheat genotypes were tested for resistance to spot blotch (*Bipolaris sorokiniana*) under natural epiphytotic circumstances on dates (15 December and 28 November) in 2021 and 2022. The Raj 4015 and Agra local wheat genotypes were used as a susceptibility check in the experiment's modified design. For both growing seasons, disease scoring was performed three times, seven days apart. The area under the Disease Progressive Curve (AUDPC) and disease severity were computed. Disease severity and AUDPC levels differed considerably between the genotypes examined for both growth seasons. A review of the data revealed that, of the 218 genotypes examined, none were determined to be immune (score 00-01). (Score 12–24) No genotypes were shown to be resistant. Ninety-four genotypes were discovered to be just moderately resistant to spot blotch. There are four genotypes pes susceptible spot blotch and 120 moderately susceptible individuals. This shows that regardless of the genotypes of wheat farmeseeding-resistant varieties of wheat are beneficial for lowering yield loss due to spot blotch disease.

Keywords: Screening, AUDPC, Evolution, spot blotch, scoring, wheat

Introduction

Wheat is one of the most widely produced and consumed grains in the world is wheat. It provides 20% of the world's population's total calories and protein (Poudel and Bhatta, 2017) [6]. For a sizable portion of the world's population, wheat (*Triticum aestivum* L.) serves as their main source of nutrition. The crop comes in second place to rice in terms of overall output in India. In this highly populated area of the world, it is crucial to guarantee food security. 13 percent of the world's total wheat crop is produced in India. According to Kronstad (1998) [1], by 2020, the world's population would require around 1,050 million tonnes of wheat, while India's demand will be between 105 and 109 million tonnes (Shoran *et al.*, 2005) [2]. This means that the demand for wheat will increase more quickly than that for any other major crop. *Cochliobolus sativus* (Ito and Kurib.) Drechsler ex Dastur [anamorph: *Bipolaris sorokiniana* (Sacc.) Shoem causes spot blotch, which is the most significant constraint for the production of wheat and leads in a significant yield loss (Joshi *et al.*, 2007) [3]. Crop rotation, chemical management, controlling planting timing, and the adoption of resistant varieties are all effective ways to manage B. sorokiniana. Researchers have worked extremely hard to uncover and create genetic resources for spot blotch resistance since genetic resistance is one of the most effective ways to prevent illness (Singh *et al.*, 2006) [7].

Methods Materials

Evaluation of wheat genotypes for disease resistance

The experiment was conducted at the Acharya Narendra Deva University of Agriculture and Technology's Main Experimental Station in Kumarganj, Ayodhya (U.P.) between Rabi 2021–22 and 2022–23. Seeds from 218 genotypes of the All India Co-ordinated Wheat and Barley Improvement Project were collected and sent to the Department of Genetics and Plant Breeding at the Acharya Narendra Deva University of Agriculture and Technology in Kumarganj, Ayodhya (U.P.). Two rows of border rows were planted with Raj 4015 and Agra local, a plant vulnerable to foliar blight, throughout the whole perimeter of the experiment. The seed was also sown every 20 entries. All recommended agronomic and cultural techniques were employed to yield the high-quality crop. The details of the experiments are as follows:

Observations recorded

Disease severity after Based on the percentage of blighted areas on the flag and flag-1 Leaf at the blooming, soft dough,

and hard dough phases, Kumar *et al.* (1998) ^[1] developed a double-digit scale. Each chosen plant's disease score was twice recorded.

The double-digit scale, based on per cent blighted area on the flag leaf and one leaf just below given by Kumar *et al.* (1998) ^[1].

| A double-digit* scale for appraising blight severity | | | | |
|------------------------------------------------------|------------|-------------|-----------------------------|----------------|
| Sr. No. | Severity** | | Rating | |
| | Flag leaf | Flag-1 leaf | Disease response | Range of value |
| 1. | 0 | 0-1 | Immune (I) | 00-01 |
| 2. | 1-2 | 2-4 | Resistant (R) | 12-24 |
| 3. | 3-4 | 4-6 | Moderately Resistant (MR) | 34-46 |
| 4. | 5-6 | 6-8 | Moderately susceptible (MS) | 56-68 |
| 5. | 7-8 | 8-9 | Susceptible (S) | 78-89 |
| 6. | 9 | 9 | Highly susceptible (HS) | 99 |

* First and second value respectively, represents per cent blighted area on the flag leaf and flag-1 leaves.

** Values 1, 2, 3, 4, 5, 6, 7, 8 and 9 respectively correspond to 10, 20, 30,40, 50, 60, 70, 80 and 90 per cent blighted areas.

Spot blotches during the dough stage were counted using a double-digit, 0-9 scale. The leaf under the flag leaf and the leaf above it were used to grade the disease's prevalence. The flag leaf's score is provided by the first of two digits, while the following (flag-1) leaf's score is provided by the second digit. The disease severity was calculated as a percentage of leaf area damaged at the dough stage using the Directorate of Wheat Research (DWR), Karnal, double-digit score. An average answer was calculated by subtracting the means of the two digits separately. The percent disease index (PDI) was calculated using the formula shown below:

$$\text{PDI} = \frac{\text{Sum of all numerical ratings}}{\text{Total number of plants X maximum grade}} \times 100$$

In each plot 10 randomly selected plants were scored.

Result and Discussion

Since the use of resistant varieties is considered to be the method for disease management, therefore, the studies were carried out for the search of source of resistance against the spot blotch of wheat caused by *Bipolaris sorokiniana*. A total number of 218 genotypes of wheat were screened against *Bipolaris sorokiniana* under artificial epiphytotic conditions (Fig 9 & 10). Results of varietal screening have been presented in Tables No. 2 and 3. A perusal of data showed that out of two hundred eighteen genotypes tested, none genotypes have been found immune (score 00-01). None genotypes were found resistant (score 12-24). Ninety-four genotypes were found moderately resistant against spot blotch. Some of these were AKDW-5348, AKAW-5440, AKAW 5512, AKAW-5514, AKAW-5517, JKW 301, JKW 302, JKW 303, JKW 304, JKW 308, SKW-367, SKW-369, SKW-373, SKW-375, SKW-376, SHUATS-W63, Lok-2021-3, Lok-2021-4, DSS-15-1737, DSS-16-1766-1, DSS-16-1792-1, DSS-16-1826-1, RAUW 107, RAUW 108, RAUW 109, RAUW 110, RAUW 111, RAUW 112, VW 2102, VW 2106, VW 2109, VW 2115, VW 2117, VW 2123, VW 2128, VW 2132, VW 2134, VW 2138, VW 2141, VW 2143, VW 2144,

AreaThe areaer disease progress curve (AUDPC)

The AUDPC calculated for 218 wheat genotypes on the basis of plant disease intensity varied from 168.0 to 1022.0 first year and 168.0 to 899.5 second year showing the fast progress

of disease in all genotypes. It was observed that different wheat genotypes expressed varied types of disease response against *Bipolaris sorokiniana* under artificial epiphytotic conditions in the field.

Table 3: Categorization of wheat genotypes against the response of spot blotch disease under artificial disease pressure (2021-2022) (2022-23)

| S. No. | Disease Reaction | Score | No. of Genotypes | Genotypes |

In a field, 218 different wheat genotypes were tested for the presence of *Bipolaris sorokiniana*. None of these genotypes (scoring 00-1) have been discovered to be immune. Ninety-four genotypes were discovered to be just somewhat moderately resistant to spot blotch. AKDW-5348, AKAW-5440, AKAW 5512, AKAW-5514, and AKAW-5517 were a few of them. 120 genotypes were found to be just somewhat moderately susceptible to spot blotch. Four genotypes were discovered to be found susceptible to spot blotch, including AKDW-5442, AKAW-5446, AKAW-5447, AKAW-5448, AKDW-5516, WSM-131-2-1, WSM-138, JKW 300, JKW 305, JKW 306, JKW 307, JKW 309, and SKW-368. These included the CG2102, Infector, AKAW-5449, Raj 4015, and Agra local.

The AUDPC calculated for 218 wheat genotypes on the basis of plant disease intensity varied from 168.0 to 1022.0 first year and 168.0 to 899.5 second year showing the fast progress of disease in all genotypes. It was observed that different wheat genotypes expressed varied types of disease response against *Bipolaris sorokiniana* under artificial epiphytotic conditions in the field.

Since the use of resistant varieties is considered to be the best method for disease management, therefore, the studies were

carried out for the search of source of resistance against the spot blotch of wheat caused by *Bipolaris sorokiniana*. A total number of 218 genotypes of wheat from the ICARDA center (International Centre for Agriculture Research in Dry Land Areas Aleppo, Syria), were screened against *Bipolaris sorokiniana* under natural epiphytotic conditions.

None genotypes have been found immune (Score 00-01). Ninety-four genotypes were found moderately resistant against spot blotch. Some of these were AKDW-5348, AKAW-5440, AKAW 5512, AKAW-5514, and AKAW-5517. One hundred twenty genotypes were found moderately susceptible against spot blotch. Some of these were AKDW-5442, AKAW-5446, AKAW-5447, AKAW-5448, AKDW-5516, WSM-131-2-1, WSM-138, JKW 300, JKW 305, JKW 306, JKW 307, JKW 309, SKW-368, and four genotypes were found susceptible against spot blotch. Some of these were AKAW-5449, Infector, Infector, CG2102, Raj 4015 and Agra local.

Singh *et al.*, (2002a) evaluated 325 genotypes against the spot blotch. Out of these 256 genotypes 3 genotypes namely, NW-2043, MACS-2942 and HUWL -99003 gave resistant reaction, while 75 showed moderately resistant reaction.

Were found susceptible against this disease. Several scientists

have reported variable responses of different wheat genotypes.

Iftikhar *et al.*, (2012) ^[4] screened 56 commercial wheat varieties against spot blotch resistance under controlled and field conditions. Out of 56 commercial varieties, 12 varieties showed moderate resistance (MR) reaction under *in vitro* and *in vivo* conditions and 2 varieties showed moderate resistance at 2 scales under both conditions. Thirty-two varieties showed moderate susceptible (MS) and susceptibility (S) under controlled conditions but had moderate resistance under field conditions, whereas, 9 varieties including Faisalabad-83, 85, Inqilab-91, Kaghan-93, Kirin- 95, Kohinoor- 83, MH-97, Rohtas-90 and Zarlashata showed moderate resistance under both controlled and field conditions at 1 scale level.

Ojha *et al.*, (2016) ^[5] evaluated of 100 screened entries 20 number of genotypes showed highly resistant or immunity to the disease, whereas 28 genotypes were resistant, 22 genotypes moderately resistant, and 15 moderately susceptible and 15 genotypes susceptible.
